DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claims 7-9 are rejected under 35 U.S.C. 102(b) as being anticipated by Campbell et al (US patent 5,437,040).

As per claim 7, Campbell teaches a system comprising: a delay circuit (22) configured to receive a standby signal (12SB) from a power supply, wherein the delay circuit is configured to deliver a delayed standby signal a predetermined period of time after receiving the standby signal; and a detection circuit (18) configured to receive the delayed standby signal, wherein the detection circuit is configured to deliver a control signal for a power supply in response to receiving the delayed standby signal (col. 5, line 28 – col. 6, line 21).

As per claim 8, Campbell teaches a stabilizer circuit (Figures 3, 4) configured to receive the standby signal (12SB) and to receive the delayed control signal (DCON), wherein the stabilizer circuit is further configured to provide the delayed control signal to a power supply to ensure a stable transition during the receipt of the delayed control signal by the power supply (col. 9, line 31; col. 10, lines 24-58).

As per claim 9, Campbell teaches the power supply providing the standby signal and receiving a delayed control signal (Figure 1).

Allowable Subject Matter

3. Claims 1, 3, 4, 6, and 17 are allowed.

4. The following is a statement of reasons for the indication of allowable subject matter: The prior art of record fails to teach or fairly suggest a delayed power-on system comprising a power supply, a detection circuit, a delay circuit and a stabilizer circuit, wherein the stabilizer circuit receives a standby signal from the power supply and a delayed control signal and further provides a stable transition when said delayed

Art Unit: 2836

control signal is provided back to said power supply as in the claimed combination of elements recited in claims 1, 4, and 17 respectively.

5. Art of general nature has been cited for applicant's review.

Response to Arguments

6. Applicant's arguments with respect to claim 7 have been considered but are moot in view of the new ground(s) of rejection.
